

Personal Redesigns

Version 1: Terry

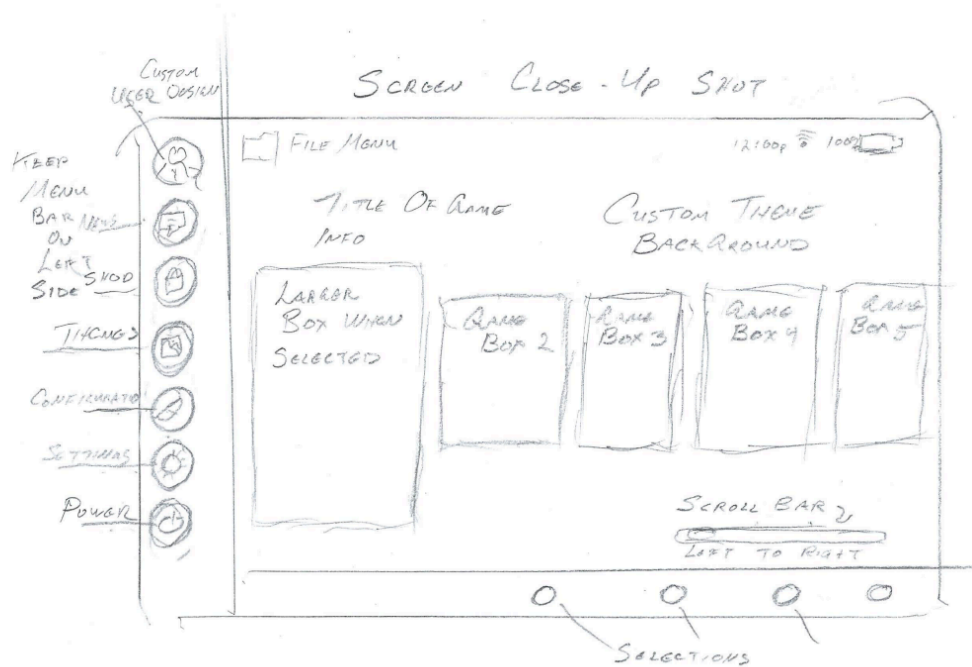

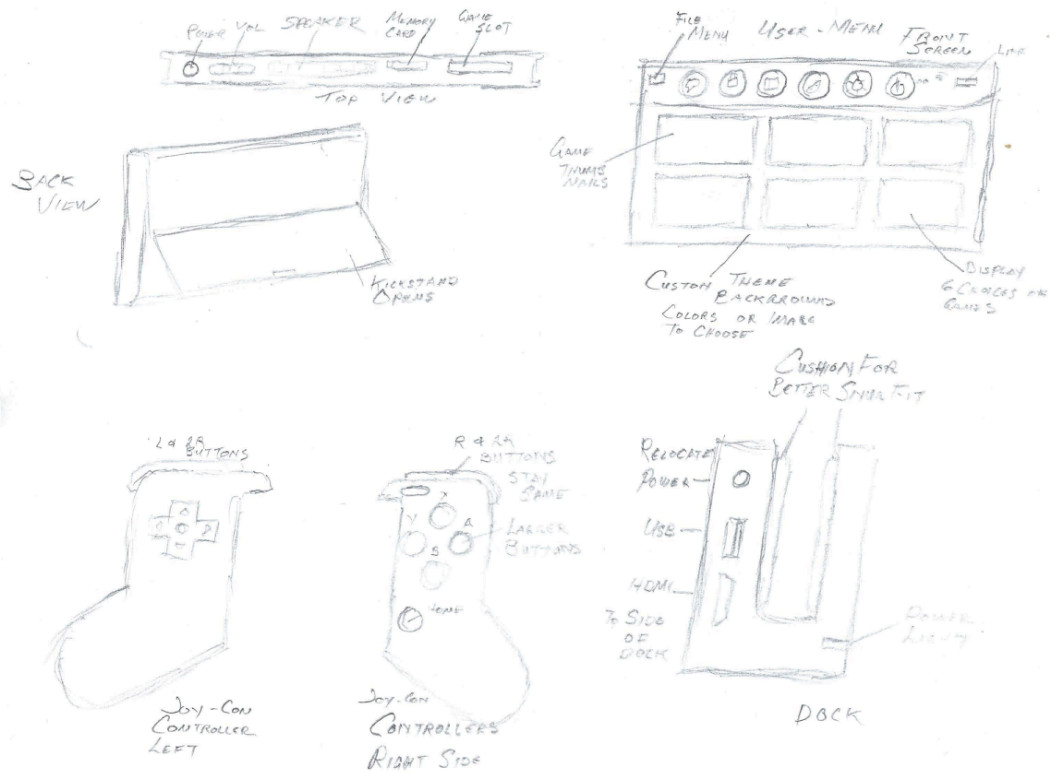

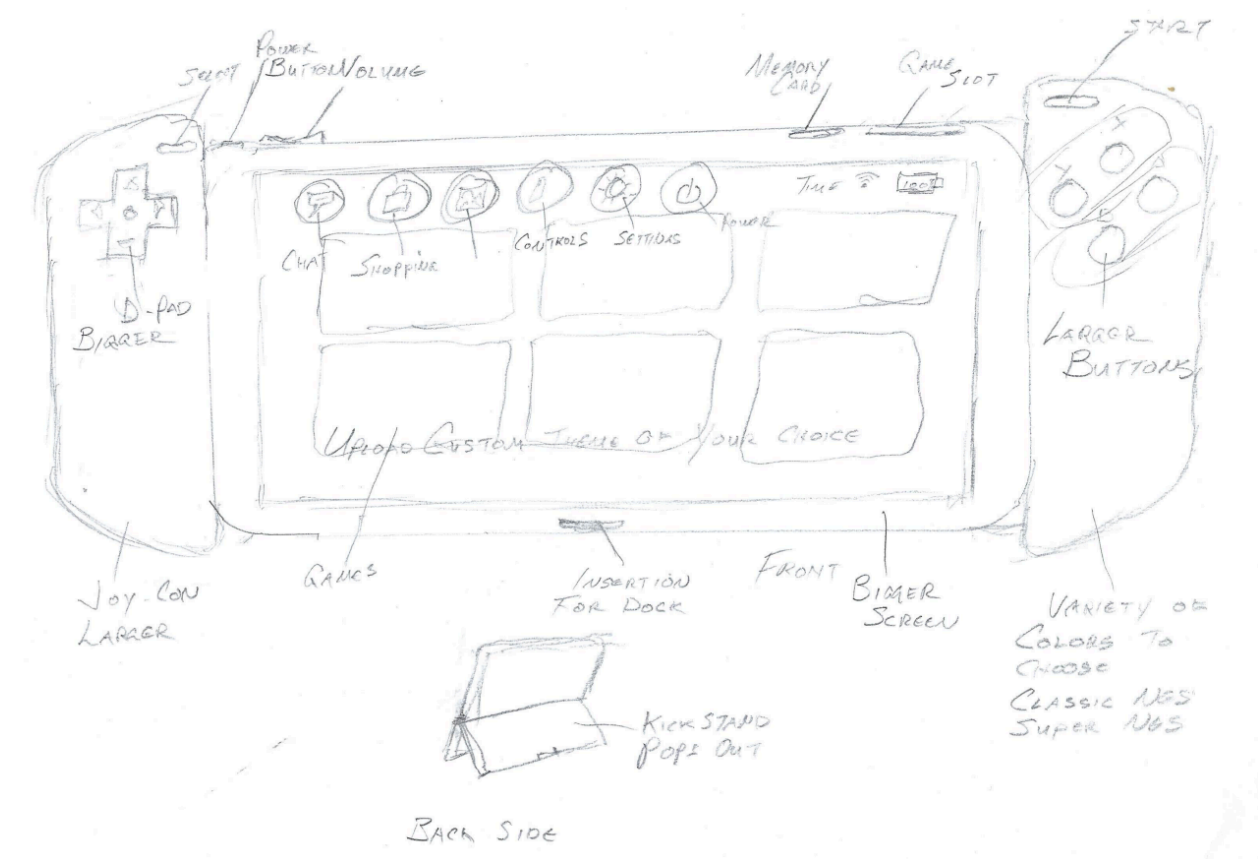

Version 2: Brad

Version 3: Hamid

Difference Between Versions

Collectively as a group we all redesigned different versions of the Nintendo Switch console itself, with all of us having different versions of the kickstand on the back as we all have different concept of how they operate such as either adding just a small ridge on the original design to better pull out, or making the stand wider so it is more easily balanced when placed on a surface. Another big difference is the choices made for the home menu screen, even though most of us have a similarity in terms of having the menu icons in the upper area of the screen we still have differences in the way they are laid out. The controllers also show a difference in design as some are longer and have a ridge at the end so it makes it easier to grip for the user or having a wider controller that fills out more in the palm to make it easier to hold. One of the more noticeable differences with the docking station is the implementation of the USB and HDMI ports on the dock as they are placed on the outer part of the docking station rather than being on the inside.

Design Picked and Why

So we all decided to go for a new design with the changes we made with the original console. We added a custom tab to the theme section allowing the user to select the color of their menu background by selecting the color they want out of a hue color wheel. We also decided to make the kickstand wider so that the console can be evenly balanced when placed on a surface. For the home menu screen we decided to move the logos to the side and instead have the rest of the space to showcase the games, on the top we would show the friends list of that particular account and show which friends are online as well. For the create folder tab we decided to showcase that on the top of the selected application to make it easier for the user to identify. In the shop menu we didn't make too many changes; the only significant change was adding a search bar in the corner since users would easily associate that with websites as they tend to be in the upper right corner. As well as there being a preview picture when you highlight a game to better get a picture of the game you are looking at; similar to how you highlight a TV show on Netflix. For the news menu we added a more section so that the user can better identify that there are more shops to view rather than it being in the corner which users found hard to identify as well as a filter button to better pick categories of the channels that they like.

Assumptions for Hardware and Users

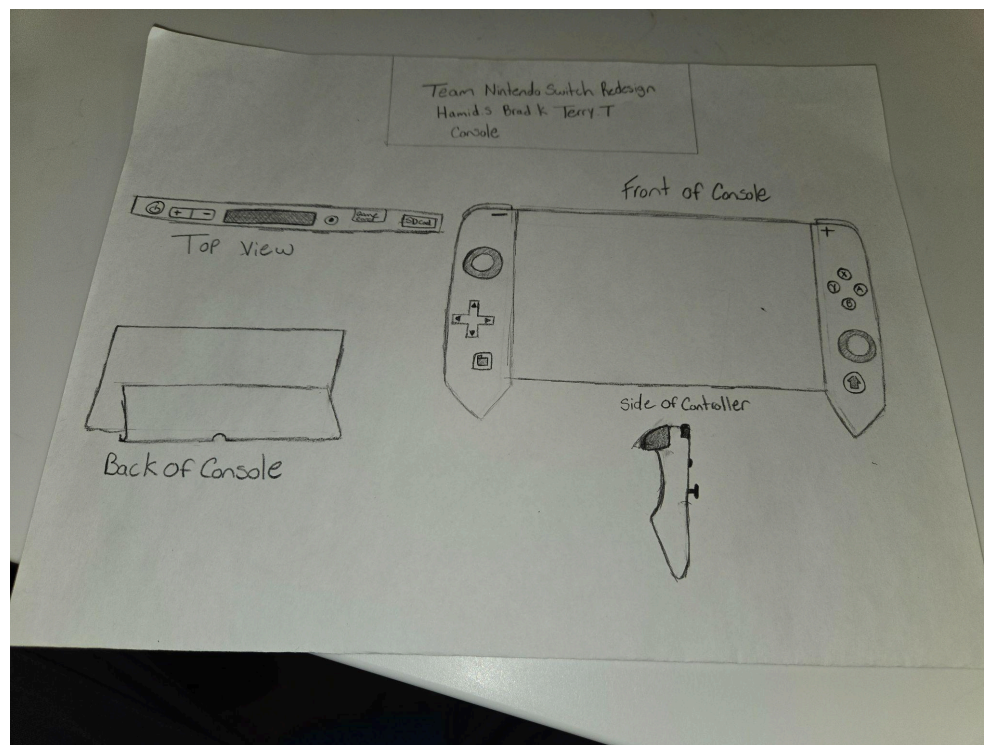

User: In terms of the age of the user we aim to select a wide age range of users as the system is advertised as a family console so the targeted age range for this design would be from ages 8-60. Making a console comfortable for use by those with smaller hands or bigger hands and even for those who have lower dexterity than those of a younger age. It'll be mainly for people who have experience with video and for those who don't have experience with video games

Hardware: For the size of the Nintendo Switch we decided to go for an 8 inch screen rather than the default 7 inches that the devices regularly have. We also are looking for a bigger base at the end of the control stick for better control and balance of the control stick. It will allow for a bigger knob and make it easier for

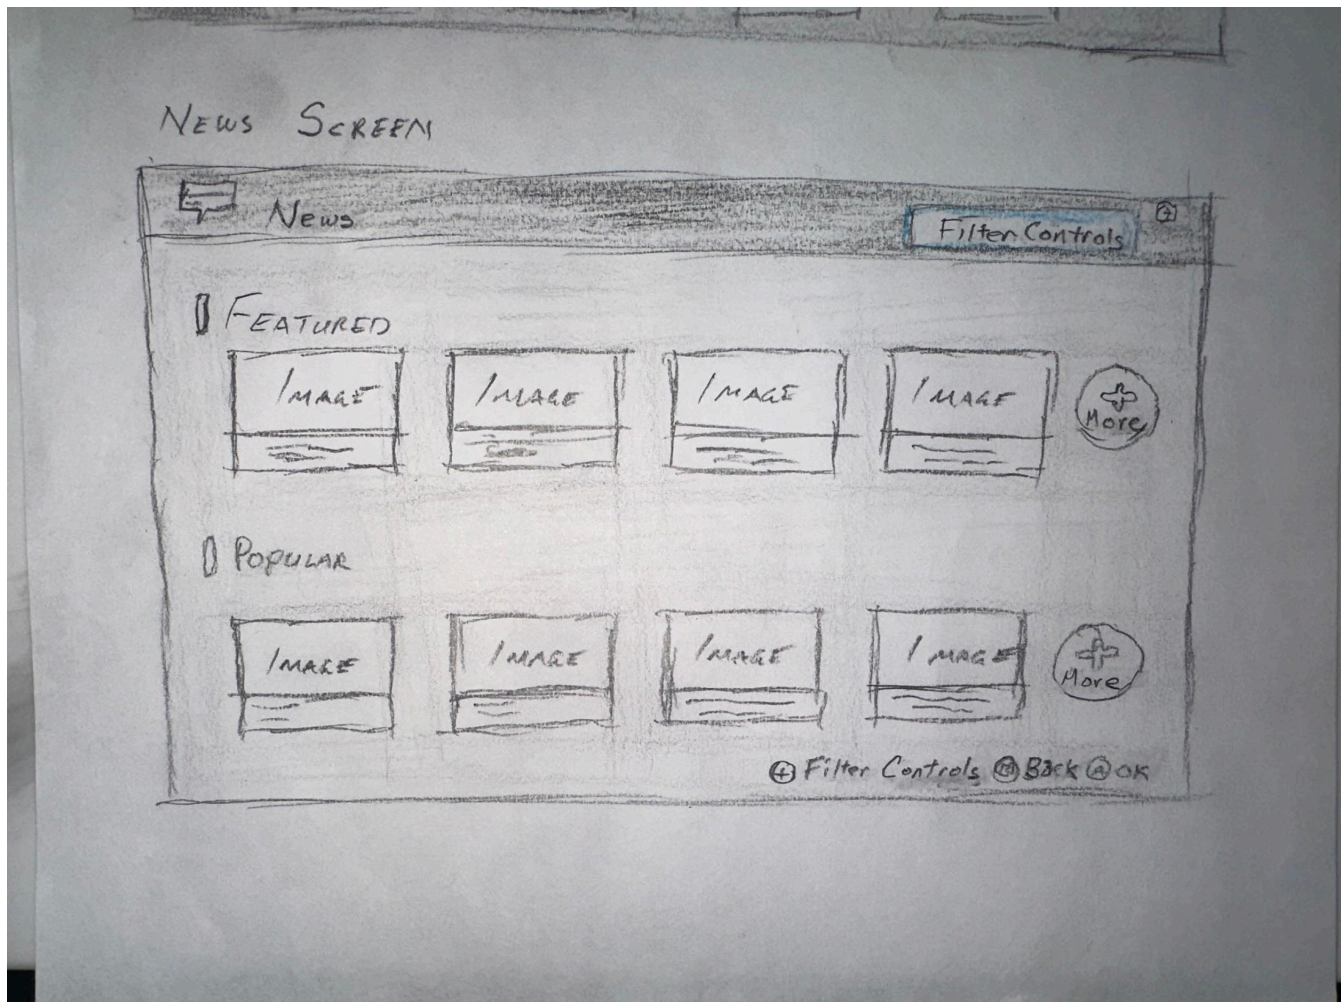

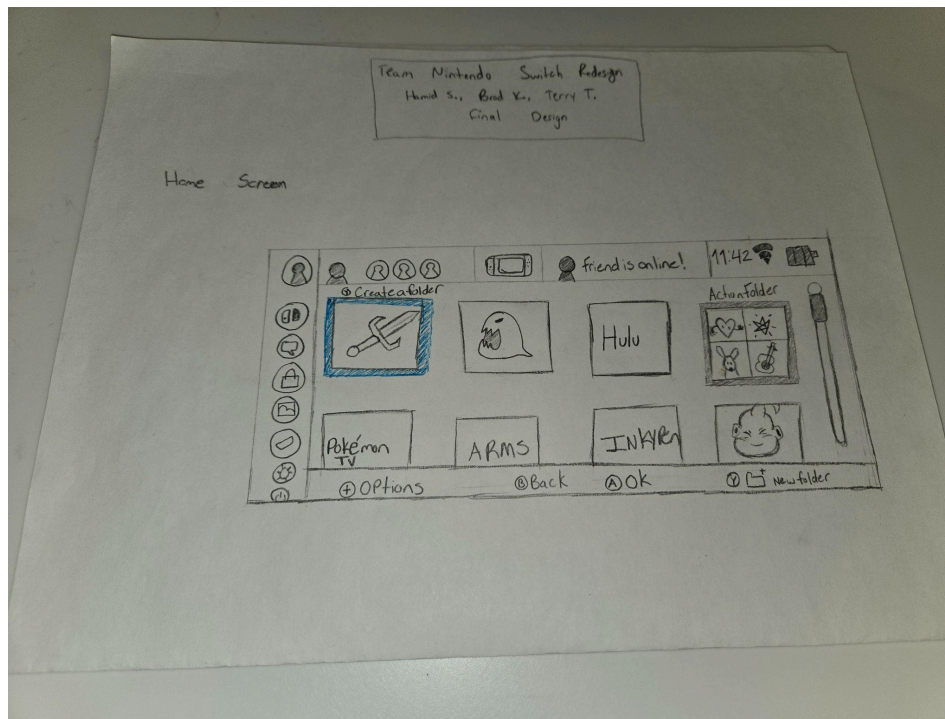

those with bigger hands to control. Then to have a plastic flap at the end of the device that is detachable and is wider to better balance the weight of the console if it is standing on a surface, we also looked into the idea of having bigger buttons on the controller to make it easier to press and more responsive to it. Along with the back buttons to feel more responsive as well. A d'pad was also introduced to the controller to give better accuracy to where the user would like to press. We decided to move the location of the SD card to the top of the console so it is not underneath the kickstand which could risk the opportunity for it to fall out or get damaged. For the controller we decided to introduce a grip at the ends of the controller to make it easier to hold when playing on the controllers without it being docked.
